

## **Divona Launches Satellite VPN Anchored by UDcast**

(4 May 2004)

UDcast's UDgateway-VPN is at the heart of Divona's new satellite VPN service and offers the same security and performance levels of a terrestrial VPN.

European satellite service provider Divona, a Monaco Telecom subsidiary, introduced its satellite VPN service in response to considerable market demand for the provision of both security and performances. The UDgateway-VPN, in association with Divona capacity and expertise, enables Divona to address an important new market eager to benefit from the network security of a traditional IPsec VPN with enhanced performances using standard satellite connections.

Targeted at businesses and other organisations needing to communicate securely with satellite connected sites, Divona's scalable service is ideal for small and medium enterprises needing a limited number of secure connections, as well as for larger organisations seeking to extend corporate LANs to remote sites. Divona's VPN service eliminates the need for private connections by offering the security of a secure private connection for the cost of a standard public connection.

UDcast provides Divona's new service with a site-to-site IPsec-based VPN with two-way acceleration over both satellite and hybrid networks. Through the use of the UDgateway-VPN appliance, Divona's service is highly flexible and easily integrates with enterprise environments without impacting existing network architectures. Divona's VPN users can also benefit from direct access to the Internet with enhanced performances.
